

“Dissolving boundaries: Stumbling towards unification in the study of species interactions”

Presented by EEB's own

Judie Bronstein

University Distinguished
Professor

Projects in the Bronstein lab focus on ecological, evolutionary, and behavioral questions about mutualism. We're particularly interested in coevolutionary dynamics, community organization, context dependency, climate change effects, and the continuum from cooperation to conflict. We are linked more by a common conceptual context rather than any single type of interaction or group of organisms.
